M.Sc. Jakub Głuszek

Software/Control Engineer

28 March 1994

Poland, Gdańsk

jjgluszek@gmail.com

About me

Ambitious control/software engineer working professionally in the power industry. Project manager of reactive power control systems for transformer stations. Desktop applications developer. Freelancer maintaining and developing ASP.NET MVC web application.

Skills

- .NET (C#)
- ASP.NET
- MATLAB
- C,C++
- HTML,CSS
- SQL
- Embedded ARM(STM32)
- LaTeX
- Git

Languages

English
Fluent in speech and writing

Polish
Native language

Education

2017-2018 Gdańsk University of Technology
Master of Science degree in Control Engineering at the Faculty of Electronics, Telecommunications and Informatics.

2013-2017 Gdańsk University of Technology
Bachelor of Science degree in Control Engineering at the Faculty of Electronics, Telecommunications and Informatics.
Member of SKALP student scientific association

Awards

2015 III place in hackathotn STM32 „Touch the World”
Project of „Miniature remote-controlled research vehicle".

Work experience

2015-present Institute of Power Engineering
Work as an engineering and technical specialist. Responsibilities include leading projects, developing embedded systems (hardware and software) as well as developing desktop applications in high level languages.

2019-present WSB University in Gdańsk
Lecturing lab classes in object-oriented programming, advanced object-oriented techniques, programming in C++, and digital signal processing.

Projects

Commercial

Wind farm master active power controller
Design a WPF (MVVM) .NET (C#) desktop application that sends reference active power value to a master controller for a 90 MW wind farm. The project includes communication with the wind farm server via the OPC protocol and the superior center using a TCP/IP stack.

Maintenance and development of CRM system
Maintenance and development of a .NET application written using the ASP.NET MVC framework for one of the leading telecommunications companies in Gdańsk.

Reactive power control systems
Leading projects of reactive power control systems for the biggest transformer stations.

Transformer tap changer position indicator
The design of a device that processes the current state of a transformer’s tap changer position and transmits the information to other devices. In addition to standard binary outputs, serial and network communication protocols were used in the design. The converter has multi-mode fiber optic outputs, Ethernet, RS485, and a 4-20 mA current loop.

Current loop ± 20 m to Modbus protocol converter
The device process the current loop serial communication (four channels) and sends data via RS485 and Modbus protocol to other devices.

Hobbyist

RIAA Phono Preamp based on the STM32F7 microcontroller
The chip performs RIAA correction using IIR biquad IIR filters. The project includes a DSP coprocessor, touch screen display, external SDRAM memory, and audio codecs.

I agree to the processing of personal data provided in this document for realising the recruitment process pursuant to the Personal Data Protection Act of 10 May 2018 (Journal of Laws 2018, item 1000) and in agreement with Regulation (EU) 2016/679 of the European Parliament and of the Council of 27 April 2016 on the protection of natural persons with regard to the processing of personal data and on the free movement of such data, and repealing Directive 95/46/EC (General Data Protection Regulation).
